

Directory of Scanography

a.k.a. Scanner Photography, Scannography
Compiled by Patri Feher and updated monthly since 2004

To submit a photoartist, digital artist, photographer or scanographer known to be employing a flatbed scanner to capture living or preserved flora/fauna, three-dimensional objects or human/animal portraiture or as an element of mixed media, please send the link or artist's e-mail address to Rongorongo@aol.com (Patri) or www.postmaster@scannography.org (Christian). Please help us maintain this list by submitting related news, publications or exhibit information; cyber gallery link updates or to report a non-working link!

Links in *red designate a site containing links to more artists.*

Most artists are listed under the *first initial of the last name* when the first and last name are known, or when known by a single name or business name. For members of group gallery sites (such as flickr) the user name will be listed only when no other identification is found. Listings for multiple artists (associated with a group exhibit or representation) may also list the members individually. The artists listed are often professors, authors and "conventional" photographers. "Artists at Large" refer to individuals without a web presence or very limited web appearance and artists without current contact information. Please let us know if you know where these guys are hiding! *Only cyber gallery links appear here*- for e-mail addresses, phone numbers, snail-mail addresses please visit the artist's website. (Exception: at their request, e-mail addresses appear for the few artists without a formal web gallery. Artists "at large" may have location information when known.)

As a researcher I need documentation about scanography....if you have knowledge or access supporting the development of this medium I'd be very interested in seeing/hearing what you have...

As far as I can document the earliest "scanography" was accomplished by Keith Smith and Sonia Sheridan, artists who worked independently with a camera developed by 3M that looked more like what we now call a copier. However, this device made a negative as well as spitting out a positive image on a transferable matrix. A mosaic of images were heat-transferred to 11 x 47 feet of fabric! This work was exhibited at MoMA (Museum of Modern Art, NYC) in April 1974. Artist-friendly scanners as we've known them since the 1990's are thankfully much simpler devices since the "capturing" is accomplished with a separate computer and the printing being a separate device as well. Darryl Curran pioneered an exhibit of "scanograms" created from 1993-96 on a rented Argus scanner at Nash Editions. J. Seeley was also employing an Agfa Arcus scanner as a camera by 1998. And, apparently so were several other pioneers, all silently experimenting. Because so many artists worked independently without ballyhooing their work, it's not possible to provide strongly documented claims as to who was doing what and when. But from studying artist biographies I've discovered that personal emotional setbacks have motivated several photoartists to pursue this medium and I wonder what is it about this particular process that appears to have such "healing" properties. By the year 2000 a handful of scanographers began exhibiting images on the web. And a trickle of how-to articles was soon to follow, including the wildly popular website "scanner camera project" by Michael Golembewski. Though there are always going to be enchanted hobbyists who delight in the challenge of scanning silly household objects, their pets or themselves just to see the result, what began as a curious novelty in the 1990s has developed into an exciting emerging artistic medium.
